

ABSTRACT OF THE DISCLOSURE

An electronic equipment is provided with a fluid device using fluid including an additive, a main body comprising an installation site for installation of the fluid device and
5 a detection part reserving the fluid. The detection part makes the fluid visible by means of the additive or is provided with a detection substance changing its nature when contacting the fluid, thereby leakage of the fluid is detected. The detection part may be further provided with electrodes to measure an
10 electric property change therebetween. The detection part is disposed on either the installation site or the fluid device.
